INTRODUCTION

In the Neurocritical Care Unit (NCU), bedside assessment of the pupils (size, shape, reactivity, and relative symmetry) is a crucial part of the neurological examination for patients with acquired brain injury. For many years, nurses were trained to assess the pupils with flashlights. Although the pupillometer is easy to use and more reliable, the compliance is low. One of the many factors that affects compliance is accessibility to the device.

MATERIALS & METHODS

This is a secondary analysis of a prospective END-PANIC registry data. The END PANIC registry is a prospective registry of pupillometer and patient physiologic data. The data abstraction timeline for this study is below:
- February 6, 2018- March 4, 2018
- Pre-implementation (6 pupillometers)
- March 5, 2018 – April 5, 2018
- Run In phase (20 pupillometers in room)
- April 6, 2018 – April 30, 2018
- Post-implantation (20 pupillometers)

RESULTS

A total of 162 patients totaling 2336 pupillary assessments were analyzed. In pre-implementation period 80 patients with 1160 readings and in post-implementation 82 patients with 1176 readings.

<table>

</tr>
</tbody>
</table>

The univariate analysis, of the proportions of the pupillary assessment shows in the Pre-group a mean of 1.09 and median of 0.75. and in the Post-group a mean of 4.98 and a median of 4.63.

</table>

Diff (1-2) = -3.89 2.66

A T-Test shows a statistical significance variance between the means of proportion in pre-group and post-group (F=3.18; \(p<0.0001\)). Suggesting that when the pupillometer was in every room there was pupillometer readings complete.

REFERENCES

CONCLUSIONS

After providing one device per room, the proportions in the post implementation group was higher, indicating an increase in the number of the pupillary assessment using the pupillometer during the NCU stay.

HYPOTHESIS

\(H_0\): proportion of pupillary assessment before implementation = proportion of pupillary assessment after implementation.

\(H_a\): proportion of pupillary assessment before implementation \neq \) proportion of pupillary assessment after implementation.

OBJECTIVE

To compare compliance rate of the pupillary assessment among nurses in the NCU before and after providing one device per room.

STATISTICAL ANALYSIS

The statistical analysis included the proportions (total readings/ICU Length of stay) of the pupillary assessment per each patient before and after placing a pupillometer in each room. After that the mean of proportions for each group was determined, a T-test for independents groups was used to determine the variance of the means.

“An increase in the number of devices allowed an increase in the compliance of the pupillary assessment among nurses in the Neurocritical Care Unit”
